

A big concern in the HE was the order of the bottom icons and the gradients. So I took away the gradients and locked the order of the icons. The active page uses our teal color to indicate which page you are on. This control is also more consistent with the other controls throughout the app.

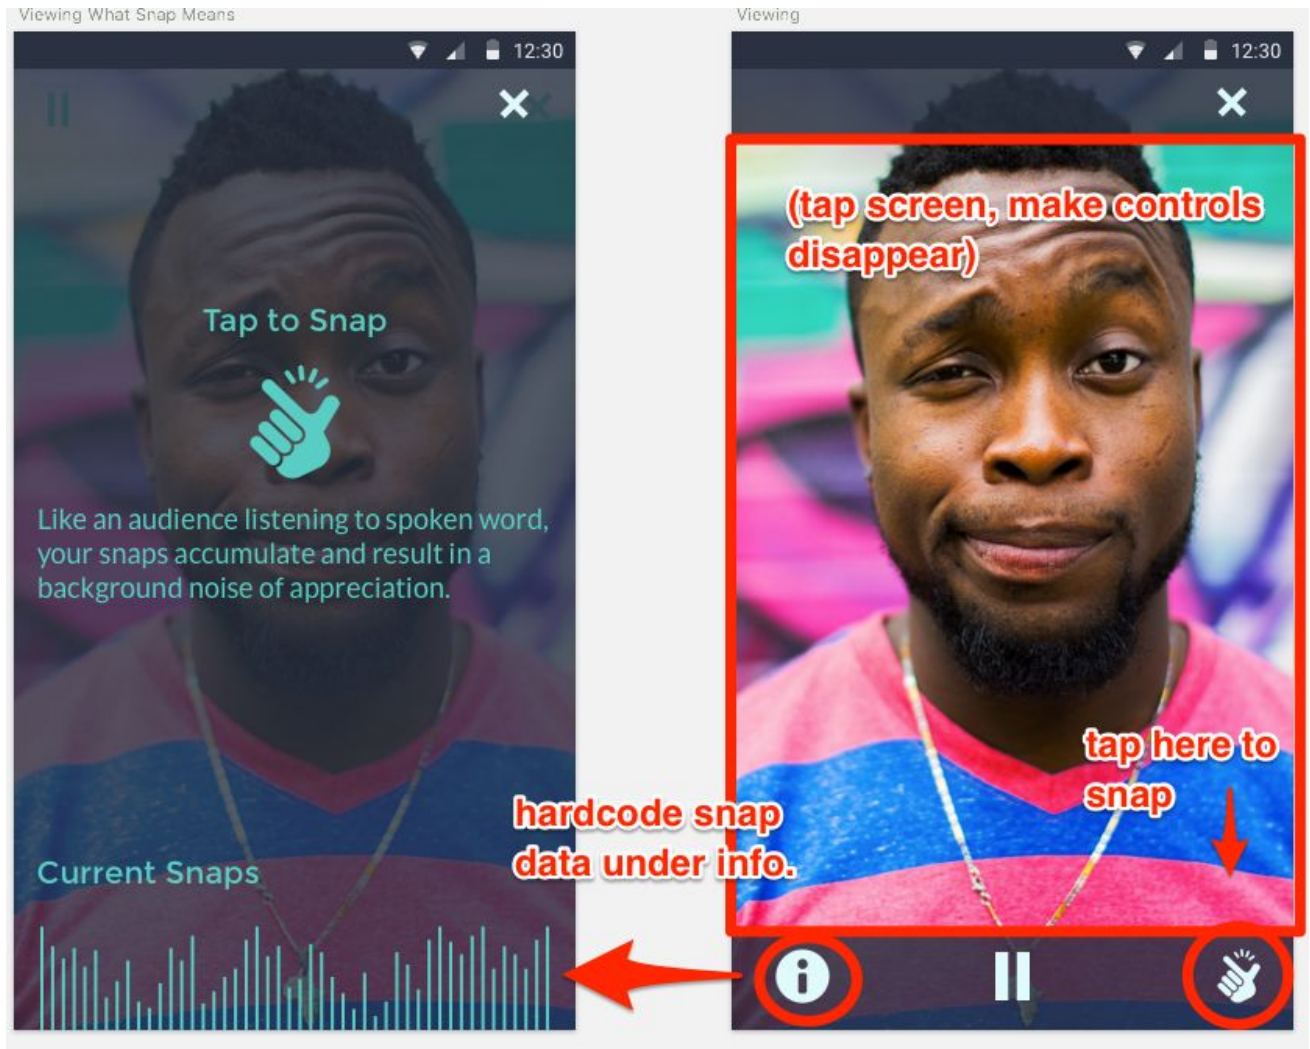

The Publish button is now just an icon for consistency. Also, we have removed the location. We can either use the phone as location, or just hardcode stuff. Less to worry about when it comes to coding. One thing that came up in the HE is having the video auto playback when done recording, like snap chat.

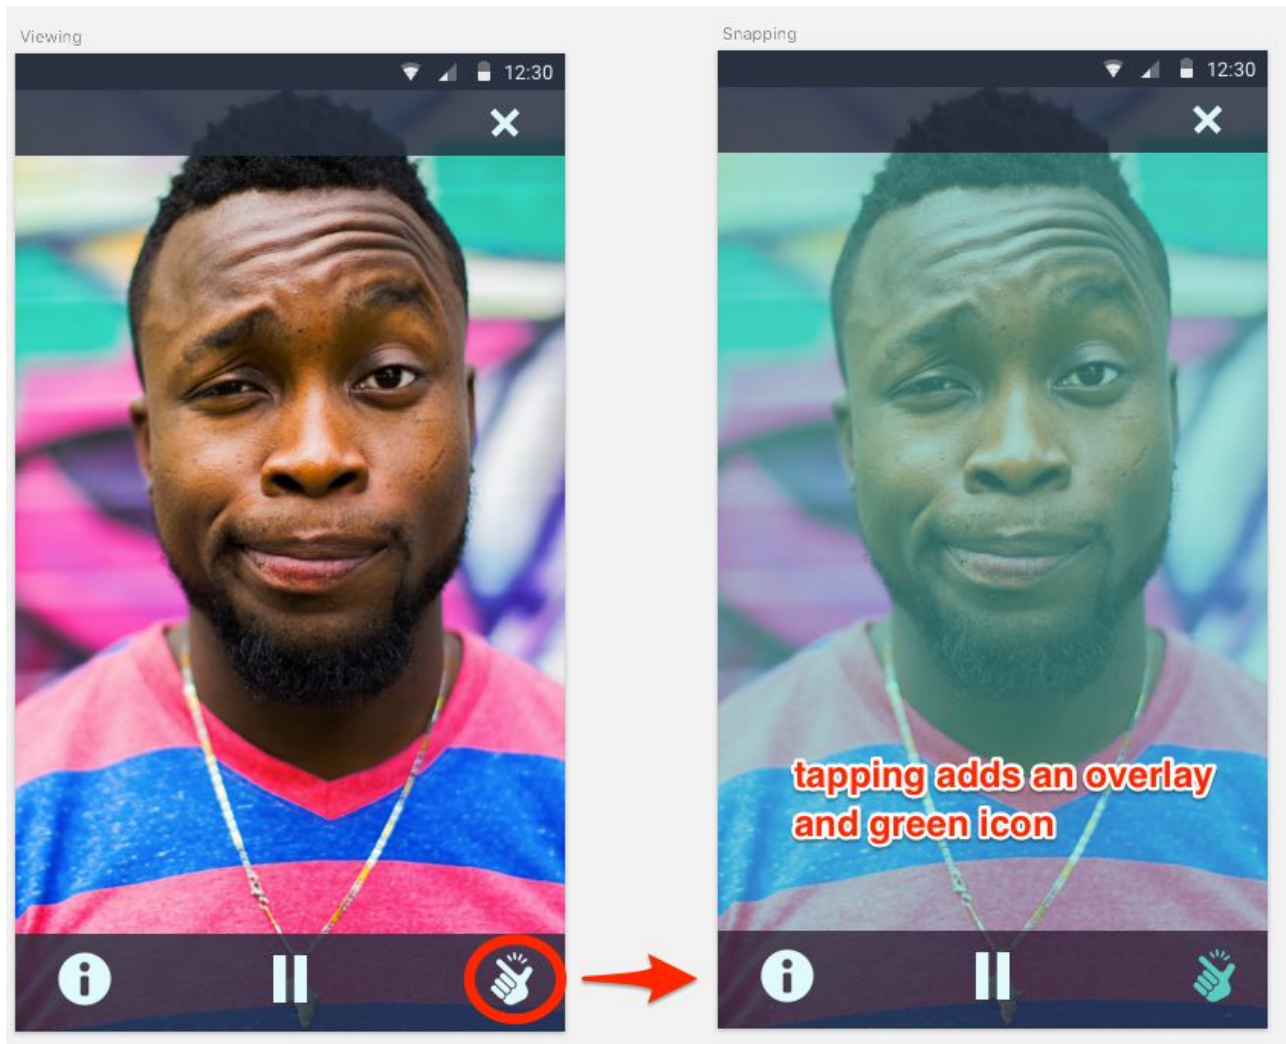

Adding in an “are you sure” screen in a couple key places

These features (time and record) come from the iOS internal app. I figured we can just steal it from there when recording. If you can't make it teal I don't think it is a big deal.

OK this is a big change but I think it is more consistent design and will make coding way easier. Putting the current snap data under the info screen means we can "hard code the snaps" and not worry about having a dynamic overlay. Also, tapping the snap icon means we don't have to worry about touching the full screen. Finally, it would be awesome if touching the videos could make the controls disappear, like most video playing apps (see iPhone recording app)

Tapping snap gives a visual cue by overlaying a translucent teal color.

Record w/ Teleprompter
